

XO-C

Topical Collagen Powder Wound Dressing

XO-C

Topical Collagen Powder Wound Dressing

XO-C is an absorbent topical dressing made of a matrix of microfibrillar collagen, indicated for the management of moderate to severe exudating wounds, and for the control of minor hemorrhaging.

XO-C helps to create a favorable physiological environment to support wound healing. The XO-C formulation preserves the structural and functional characteristics of collagen. Certain products that are on the market, such as denatured collagen or hydrolyzed collagen, have their original molecular structure altered. XO-C is made with an absorbent microfibrillary collagen formulation, which assists a favorable physiological environment for wound healing.

XO-C is applied directly to the wound, protecting the wound bed and the new delicate tissue.

In addition, because is derived from microfibrils of collagen, it is an excellent topical application for wounds located in areas where constant range of motion may impact the ability for collagen sheets to remain intact, or for wounds located in places difficult to reach or awkward to place a sheet topical dressing Period.

Use as an Adjunct to Surgical Procedures

- Surgical Wounds
- Trauma Wounds
- Diabetic Ulcers
- Partial Thickness Burns
- Pressure Ulcers
- Venous Stasis Ulcers

Collagen is able to take on the critical role of all stages of wound healing from stopping the flow of blood and inflammation to proliferation and remodeling.

Appropriate for Multiple Surgical Specialties
